# Negative-input Negative-output Regulator IC TK722xxCS

## 1. DESCRIPTION

TK722xxCS series is a negative-input negative-output regulator IC using silicon monolithic bipolar structure which can supply 150mA output current.

The output voltage can be set from -2.0 to -9.5V, which is trimmed in high accuracy.

TK721xxCS is supplied with ON/OFF terminal and noise reduction terminal. The ON/OFF control can be controlled directly with positive logic or CPU.

Moreover, TK722xxCS is provided with short-circuit protection and thermal shutdown.

## 2. FEATURES

- High Output Voltage Accuracy(  $\pm 2.0\%$  or  $\pm 60$  mV)
- ON/OFF control available (High ON)
- Built-in short-circuit protection and thermal shutdown.
- Guarantee 150mA output current(200mA peak)
- Ceramic capacitor available for application

## 3. APPLICATIONS

- Battery Powered Systems
- DSC, CCD bias, GaAs bias.

## 4. PIN CONFIGURATION

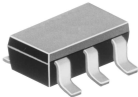

## 5. PACKAGE OUTLINE

- SOT23-5

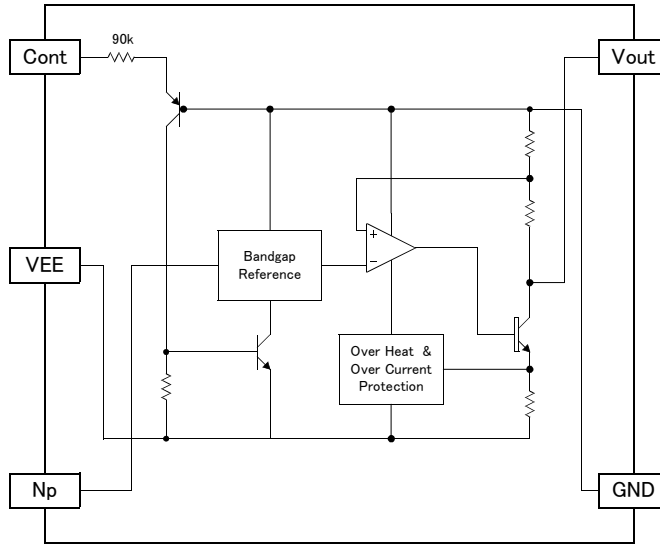

**5. ORDERING INFORMATION**

| Package   | Vout | Part Number | Marking    |     |
|---|------|-------------|------------|-----|
| SOT23-5<br> |      |             |            |     |
|   |      |             |            |     |
|   |      |             |            |     |
|   |      |             |            |     |
|   |      |             |            |     |
|   |      | -5.0        | TK72150CSC | T50 |
|   |      |             |            |     |
|   |      |             |            |     |
|   |      |             |            |     |
|   |      |             |            |     |
|   |      |             |            |     |
|   |      |             |            |     |

For other voltages, please contact the TOKO sales office.

**6. BLOCK DIAGRAM**

Control:High Level On

**7. ABSOLUTE MAXIMUM RATINGS**

$T_a=25^{\circ}\text{C}$

| Parameter                    | Symbol      | Rating     | Units              | Conditions  |
|------------------------------|-------------|------------|--------------------|---|
| Supply Voltage               | $V_{in}$    | -20        | V                  | $ V_{in} + V_{cont} \leq 20\text{V}$  |
| Control pin Voltage          | $V_{cont}$  | -0.4 ~ +5  | V                  | $ V_{in} + V_{cont} \leq 19\text{V}$  |
| Power Dissipation            |             |            |                    |   |
| (SOT23-5 Simple substance)   | $P_D$       | 500        | mW                 | $P_D$ must be decreased at the rate of $4\text{mW}/^{\circ}\text{C}$ for operation above $25^{\circ}\text{C}$ . |
| Storage Temperature Range    | $T_{stg}$   | -55 ~ +150 | $^{\circ}\text{C}$ |   |
| Operating Temperature Range  | $T_{OP}$    | -40 ~ 85   | $^{\circ}\text{C}$ |   |
| Operating Voltage Range      | $V_{OP}$    | -19        | V                  | $ V_{in} + V_{cont} \leq 19\text{V}$  |
| Output short-circuit current | $I_{short}$ | 300        | mA                 | Over Current Protection   |

Absolute maximum ratings are limits beyond which damage to the device may occur. When the operation exceeds this standard, quality can not be guaranteed.

**12. APPLICATIONS INFORMATION**

**12-1. Definition of term**

**Relating Characteristic**

**note** Each characteristics will be measured in a short period not to be influenced by joint temperature (Tj).

**Output voltage (Vout)**

The output voltage is specified with  $V_{in} = V_{out\_TYP} + 1V$  and  $I_{out} = 5mA$

**Output current (Iout)**

Output current, which can be used continuously (It is the range where overheating protection of the IC does not operate.)

**Peak output current (Iout<sub>PEAK</sub>)**

The rated output current is specified under the condition where the output voltage drops 90% by increasing the output current, compared to the value specified at  $V_{in} = V_{out\_TYP} - 1.5V$ .

**Dropout voltage (Vdrop)**

It is an I/O voltage difference when the circuit stops the stable operation by decreasing the input voltage.

It is measured when the output voltage drops 100mV from its nominal value by decreasing the input voltage gradually.

**Line Regulation (LinReg)**

It is the fluctuations of the output voltage value when the input voltage is changed.

**Load Regulation (LoaReg)**

It is the fluctuations of output voltage value when the input voltage is assumed to be  $V_{out\_TYP} - 1.5V$ , and the load current is changed.

**Ripple Rejection (R.R)**

Ripple rejection is the ability of the regulator to attenuate the ripple content of the input voltage at the output. It is measured with the condition of  $V_{in} = V_{out} - 2.0V$ . Ripple rejection is the ratio of the ripple content between the output vs. input and is expressed in dB

**Standby current (Istandby)**

It is an input current which flows to the control terminal, when the IC is turned off.

**Relating Protection Circuit**

**Over Current Protection**

It is a function to protect the IC by limiting the output current when excessive current flows to IC, such as the output is connected to GND, etc.

**Thermal Protection**

It protects the IC not to exceed the permissible power consumption of the package in case of large power loss inside the regulator.

The output is turned off when the chip reaches around 150 , but it turns on again when the temperature of the chip decreases.

**ESD**

It is tested by connecting charged capacitor to GND pin and Vin pin.

MM 200pF 0Ω 200Vmin

HBM 100pF 1.5kΩ 2000Vmin

**12-2. ESR Stability**

IC does operates with 1.0uF Cout. If it is 1.0uF or larger, the capacitor of any type can be used in all range without considering ESR. But due to the parts are uneven, please enlarge the capacitance as much as possible. With larger capacity, the output noise decreases more. In addition, the response to the load change, etc. can be improved. The IC won't be damaged by enlarging the capacity.

The input capacitor is necessary in case the battery voltage drops, the power supply impedance increases, or the distance to the power supply is far. 1 input capacitor might be necessary for each 1 IC or for several ICs. It depends on circuit condition. Please confirm the stability by each circuit.

Generally, Multi layer ceramic capacitor (MLCC) has the temperature characteristic and the voltage characteristic. Please select parts in consideration of the voltage and the temperature used.

\*The output can be seen as oscillated when the overheating protection or the overcurrent protection start operation, or the input voltage is low. In this case, please lower the power consumption, decrease the load current or make the input voltage higher.

**Selection of Cout**

Generally, a ceramic capacitor has the temperature characteristic and the voltage characteristic. Please select parts in consideration of the voltage and the temperature used. TOKO recommend B characteristic type.

**Stability area graph**

Condition: Vin=Vout\_TYP-1.5V Cin=0.1uF(MLCC)

Cout=1.0uF

### 12-3. Operating Region and Power Dissipation

The power dissipation of the device is dependent on the junction temperature. Therefore, the package dissipation is assumed to be an internal limitation. The package itself does not have enough heat radiation characteristic due to the small size. Heat runs away by mounting IC on PCB. This value changes by the material, copper pattern etc. of PCB.

The overheating protection operates when there is a lot of loss inside the regulator (Ambient temperature high, heat radiation bad, etc.). The output current and the output voltage will drop when the protection circuit operates. When joint temperature (Tj) reaches the set temperature, IC stops the operation. However, operation begins at once when joint temperature(Tj) decreases.

#### The thermal resistance when mounted on PCB

The chip joint temperature during operation is shown by  $T_j = \theta_{ja} \times P_d + T_a$ . Joint part temperature (Tj) of TK721xxCS is limited around 150 with the overheating protection circuit. Pd is the value when the overheating protection circuit starts operation.

When you assume the ambient temperature to be 25 ,  
 $150 = \theta_{ja} \times P_d + 25$   
 $\theta_{ja} \times P_d = 125$   
 $\theta_{ja} = 125 / P_d$  ( /W)

#### Example of mounting substrate

PCB Material: Two layer glass epoxy substrate (x=30mm,y=30mm,t=1.0mm,Copper pattern thickness 35um)

Please do derating with 5.9mW/ at Pd=736mW and 25 or higher. Thermal resistance is (  $\theta_{ja} = 170$  /W)

#### Method of obtaining Pd easily

Connect output terminal to GND(short circuited), and measure the input current by increasing the input voltage gradually up to 10V. The input current will reach the maximum output current, but will decrease soon according to the chip temperature rising, and will finally enter the state of thermal equilibrium (natural air cooling)

The input current and the input voltage of this state will be used to calculate the Pd.

$$P_d(mW) \cong V_{in} (V) \times I_{in} (mA)$$

When the device is mounted, mostly achieve 600mW or more.

Procedure (When mounted on PCB).

1. Find Pd ( $V_{in} \times I_{in}$  when the output is short-circuited).
2. Plot Pd against 25 .
3. Connect Pd to the point corresponding to the 150 with a straight line.
4. Pull a vertical line from the maximum operating temperature in your design (e.g., 75 ).
5. Read the value of Pd against the point at which the vertical line intersects the derating curve(DPd).
6.  $DPd \div (V_{inmax} - V_{out}) = I_{out}$  (at 75 )

The maximum output current at the highest operating temperature will be  $I_{out} = DPd \div (V_{inmax} - V_{out})$ . Please use the device at low temperature with better radiation. The lower temperature provides better quality.

**The operation area**

PCB Material : Two layer glass epoxy substrate  
 (x=30mm,y=30mm,t=1.0mm,Copper pattern thickness 35um)

Pd when mounted on the substrate mentioned above  
 (Ta=25 )  
 SOT23-5=736mW (derating -5.9mW)

The current which can be used continuously with  
 Ta=25 min is calculated by the following.

$$I_{out}(mA) = \frac{736 - 5.9 \times (Ta - 25)}{|V_{in}| - |V_{out}|} \dots \text{SOT23-5}$$

\*Iout<150mA

The operation area is the part enclosed in the line including the “0” mentioned in graph1  
 The overheating sensor may operate, or the output voltage may drop outside those area.  
 The heat radiation characteristic changes in various conditions, so please check under your condition.

IoutMAX vs IN-OUT VOLTAGE DIFF (SOT23-5)

### 12-4 Application hint

- When using together with Positive output regulator

When using positive output regulator together with this device, sometimes the voltage may not be outputted. To solve this problem, please connect Schottkey diode between GND and output, or change the timing of On/Off.

- Notes when evaluating with output terminal is connected to GND(short-circuit)

The output terminal becomes plus potential by the resonance of Cout (C element) connected to output and the short-circuit line (L element). When the output terminal becomes positive, parasitism Tr is caused inside the IC. The latch-up phenomenon occurs and in the worst case, IC may be damaged. ( $f_0 = 1 / 2 \pi \sqrt{L C}$ )

This resonance appears remarkably when using a ceramic capacitor with small ESR, etc. This can be solved by connecting 2 resistance in series. As a result, the latch-up phenomenon in IC can be prevented.

Generally, tantalum capacitor has enough ESR value and the influence of the resonance decreases.

**13. NOTES**

■ Please be sure that you carefully discuss your planned purchase with our office if you intend to use the products in this application manual under conditions where particularly extreme standards of reliability are required, or if you intend to use products for applications other than those listed in this application manual.

- Power drive products for automobile, ship or aircraft transport systems; steering and navigation systems, emergency signal communications systems, and any system other than those mentioned above which include electronic sensors, measuring, or display devices, and which could cause major damage to life, limb or property if misused or failure to function.

- Medical devices for measuring blood pressure, pulse, etc., treatment units such as coronary pacemakers and heat treatment units, and devices such as artificial organs and artificial limb systems which augment physiological functions.

- Electrical instruments, equipment or systems used in disaster or crime prevention.

■ Semiconductors, by nature, may fail or malfunction in spite of our devotion to improve product quality and reliability. We urge you to take every possible precaution against physical injuries, fire or other damages which may cause failure of our semiconductor products by taking appropriate measures, including a reasonable safety margin, malfunction preventive practices and fire-proofing when designing your products.

■ This application manual is effective from Dec. 2004 . Note that the contents are subject to change or discontinuation without notice. When placing orders, please confirm specifications and delivery condition in writing.

■ TOKO is not responsible for any problems nor for any infringement of third party patents or any other intellectual property rights that may arise from the use or method of use of the products listed in this application manual. Moreover, this application manual does not signify that TOKO agrees implicitly or explicitly to license any patent rights or other intellectual property rights which it holds.

■ None of the ozone depleting substances(ODS) under the Montreal Protocol are used in our manufacturing process.
