

## Boosting Voltage Regulators

### GENERAL DESCRIPTION

The XC62E series are a group of positive output voltage regulators that can supply up to 1A of output current using an external transistor. Low power and high accuracy are achieved through CMOS process and laser trimming technologies. The series consists of a high precision voltage reference, an error correction circuit and a short-circuit protected output driver. In stand-by mode, supply current can be dramatically cut. Since the input-output voltage differential is small, loss control efficiency is good.

The XC62E is particularly suited for use with battery operated portable products, and products where supply current regulation is required.

The series are available in an ultra small SOT-25 package.

In connection with the CE function, apart from the negative logic XC62EP series, a positive logic XC62ER series (custom) is also available.

### APPLICATIONS

Portable cameras and video recorders

Battery powered equipment

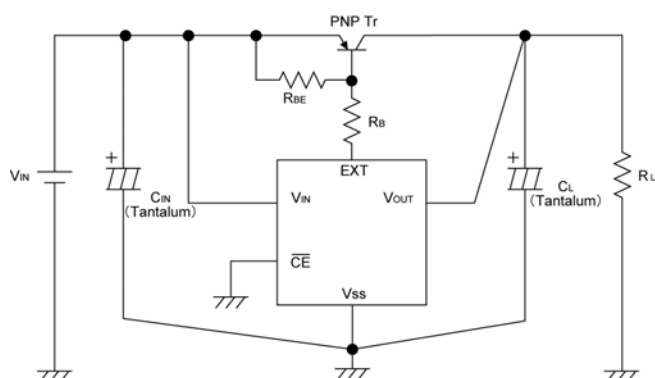

Palmtops

Reference voltage sources

### FEATURES

- Dropout Voltage** : 0.1A@100mA  
(Performance depends on the external transistor characteristics.)
- Maximum Output Current** : 1000mA
- Output Voltage Range** : 1.5V~6.0V in 100mV increments
- Highly Accurate** : Setting voltage  $\pm 2\%$
- Low Power Consumption**: 50  $\mu$ A ( $V_{OUT}=5.0V$ ) (TYP.)  
: 0.2  $\mu$ A (Stand-by) (TYP.)
- Output Voltage Temperature Characteristics**  
:  $\pm 100$ ppm/ (TYP.)
- Line Regulation** : 0.1%/V (TYP.)
- CMOS Low Power Consumption**
- Ultra Small Package** : SOT-25 mini-mold

## ELECTRICAL CHARACTERISTICS

XC62EP3002  $V_{OUT}(T)=3.0V$  (\*1)

$T_a=25$

PARAMETER	SYMBOL	CONDITIONS	MIN.	TYP.	MAX.	UNITS
Output Voltage	$V_{OUT(E)}$ (*2)	$I_{OUT}=50mA$ $V_{IN}=4.0V$	2.940	3.000	3.060	V
Maximum Output Current*	$I_{OUT\ max}$	$V_{IN}=4.0V$	-	1000	-	mA
Load Regulation (*6)	$V_{OUT}$	$V_{IN}=4.0V$ $1mA\ I_{OUT}\ 100mA$	-60	-	60	mV
Dropout Voltage (*3)	$V_{dif}$	$I_{OUT}=100mA$	-	100	-	mV
Supply Current 1	$I_{SS1}$	$V_{IN}=4.0V, V_{CE}=V_{SS}$	-	50	80	$\mu A$
Supply Current 2	$I_{SS2}$	$V_{IN}=8.0V, V_{CE}=V_{IN}$	-	-	0.6	$\mu A$
Line Regulation (*6)	$\frac{V_{OUT}}{V_{IN} \cdot V_{OUT}}$	$I_{OUT}=50mA$ $4.0V\ V_{IN}\ 8.0V$	-	0.1	0.3	%V
Input Voltage	$V_{IN}$		-	-	8.0	V
Output Voltage Temperature Characteristics (*6)	$\frac{V_{OUT}}{T_{opr} \cdot V_{OUT}}$	$I_{OUT}=10mA$ $-30\ T_{opr}\ 80$	-	$\pm 100$	-	ppm/
EXT Output Voltage	$V_{EXT}$		-	-	8.0	V
EXT Leak Current	$I_{LEAK}$		-	-	0.5	$\mu A$
CE "High" Level Voltage	$V_{CEH}$		1.5	-	-	V
CE "Low" Level Voltage	$V_{CEL}$		-	-	0.25	V
CE "High" Level Current	$I_{CEH}$	$V_{CE}=V_{IN}$	-	-	0.1	$\mu A$
CE "Low" Level Current	$I_{CEL}$	$V_{CE}=V_{SS}$	-0.2	-0.05	0	$\mu A$

The characteristics for the XC62ER series are the same as above except for the CE operating logic, which is the opposite.

### NOTE:

\*1:  $V_{OUT}(T)$ =Specified output voltage.

\*2:  $V_{OUT(E)}$ =Effective output voltage (i.e. the output voltage when " $V_{OUT}(T)+1.0V$ " is provided at the  $V_{IN}$  pin while maintaining a certain  $I_{OUT}$  value).

\*3:  $V_{dif} = \{V_{IN1} (*5) - V_{OUT1} (*4)\}$

\*4:  $V_{OUT1}$ = A voltage equal to 98% of the output voltage whenever an amply stabilized  $I_{OUT}$  ( $V_{OUT}(T)+1.0V$ ) is input.

\*5:  $V_{IN1}$ =The input voltage when  $V_{OUT1}$  appears as input voltage is gradually decreased.

\*6: The characteristics for the parameters are liable to vary depending on which transistor is used.  
Please use a transistor with a low saturation voltage level and  $h_{FE}$  equal to 100 or more.

\*7: The maximum output current value is not a value representing continuous output due to the limitations of the 2AS1213 transistor's power dissipation.

The characteristics for the XC62ER series are the same as above except for the CE operating logic, which is the opposite.

Note: \*1.  $V_{OUT}(T)$ =Specified output voltage.

\*2.  $V_{OUT(E)}$ =Effective output voltage (i.e. the output voltage when " $V_{OUT}(T)+1.0V$ " is provided at the  $V_{IN}$  pin while maintaining a certain  $I_{OUT}$  value).

\*3.  $V_{dif} = \{V_{IN1}(*5) - V_{OUT1}(*4)\}$

\*4.  $V_{OUT1}$ = A voltage equal to 98% of the output voltage whenever an amply stabilized  $I_{OUT}$   $\{V_{OUT}(T)+1.0V\}$  is input.

\*5.  $V_{IN1}$ = The input voltage when  $V_{OUT1}$  appears as input voltage is gradually decreased.

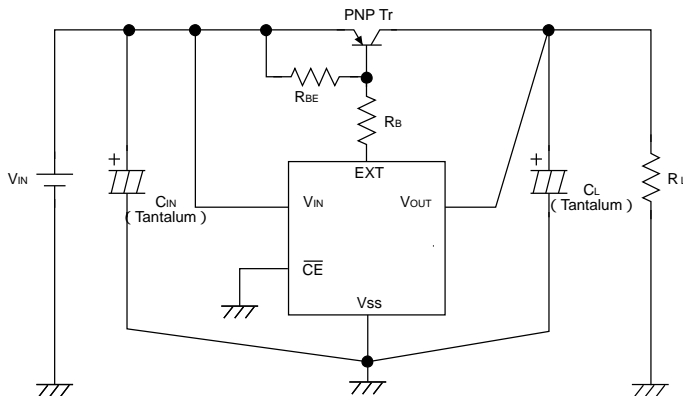

\*6. The characteristics for the parameters are liable to vary depending on which transistor is used.

Please use a transistor with a low saturation voltage level and  $h_{FE}$  equal to 100 or more.

\*7. The maximum output current value is not a value representing continuous output due to the limitations of the 2AS1213 transistor's power dissipation.

## TYPICAL APPLICATION CIRCUIT

### Standard Circuit

#### External Components:

PNP Tr.: 2SA1213

RBE: 20kΩ ~ 47kΩ

RB: Please refer to Note 2 on the following page.

CIN: 10μF (Tantalum)

CL: 47μF (Tantalum) 10μF minimum

## OPERATIONAL EXPLANATION

Output voltage (VOUT) can be fixed by revising the external transistor's base current. This can be done by comparing the detected voltage level and the setting voltage power supply level.

With the XC62EP (CE negative voltage), if a voltage above the  $\overline{CE}$  pin's "H" level is applied, the IC will enter stand-by mode where the base and differential amplifier's currents are regulated.

## NOTES ON USE

### 1. PNP Transistor

The selection of a transistor should take into account output current, input voltage and power dissipation for each specific application. It is recommended that a transistor that has a low output saturated voltage (VCE) and high hFE characteristics be used.

### 2. RB Resistor

Although the IC unit is protected by a base current remitter circuit, it is recommended that a resistor (RB) be connected between the transistor's base and the IC's EXT pin to protect the transistor.

Required output current can be calculated using the following equation although characteristic variations and conditions of use should be carefully checked before use. The following equation also indicates the conditions needed to obtain IOUT (MAX.) at VIN (MIN.). However, the larger the input current, the larger the output current (IOUT) that can be obtained.

$$\frac{V_{IN(MIN.)} - 1.2(V)}{R_B} - \frac{0.7(V)}{R_{BE}} > \frac{I_{OUT(MAX.)}}{hFE}$$

### 3. RBE Resistor, CL Capacitor

To prevent oscillation due to output load variation, use of a phase compensation capacitor CL is recommended. Please use a Tantalum capacitor of at least 10mF. Please also use an RBE resistor of less than 47k .

An RBE resistor of between 20k and 47k is recommended for less power consumption.

### 4. Input Impedance

In order to control oscillation brought about as a result of impedance at the power supply line, connect a capacitor of 10 μ F or more (Tantalum) between the external transistor's emitter and the ground pin.

### Protection Circuit

The built-in protection circuit is to protect the IC only. Therefore to prevent output shorts and overshoot current through the transistor, use of a resistor RB or an overshoot current protection circuit is recommended.

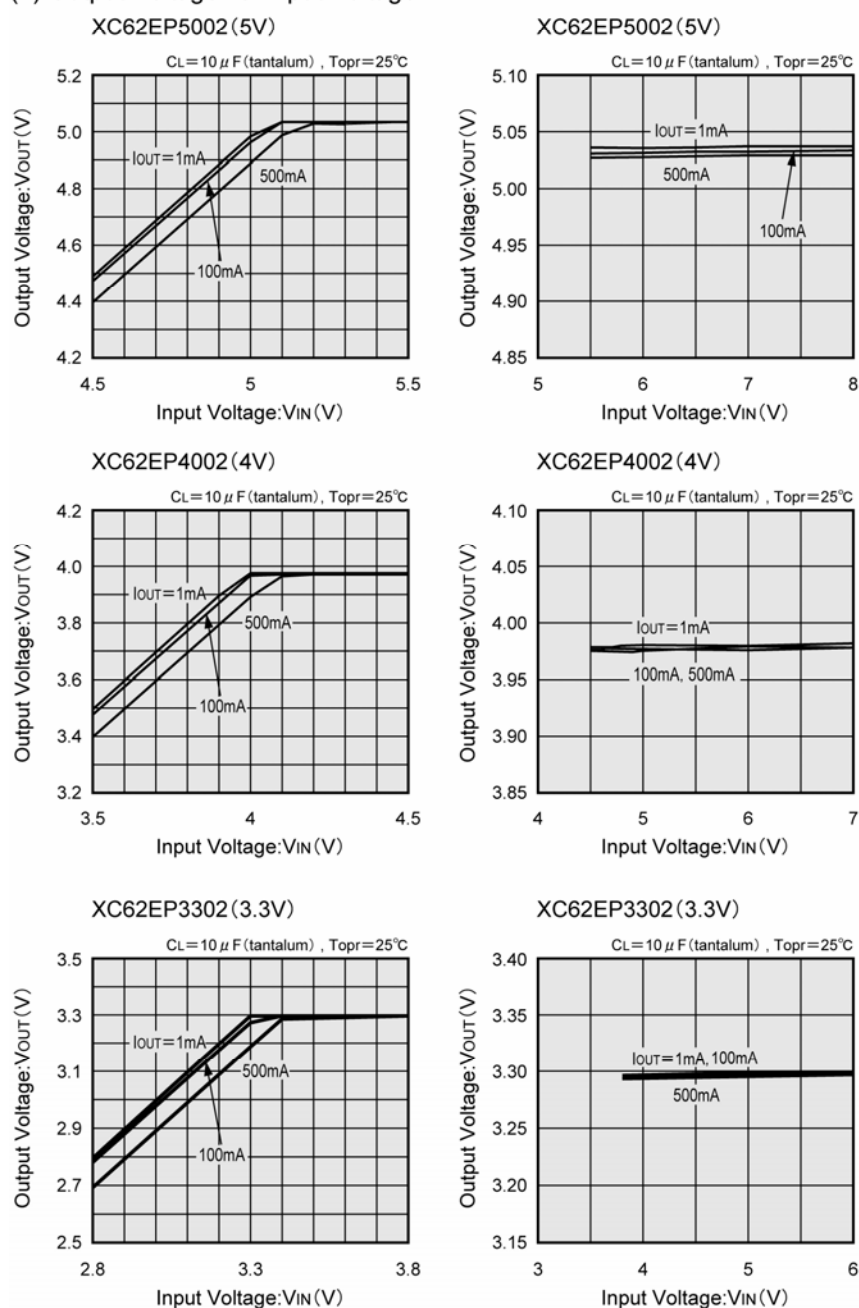

Care should also be taken with the transistor's power dissipation.
